OMAFRA's Role in Great Lakes

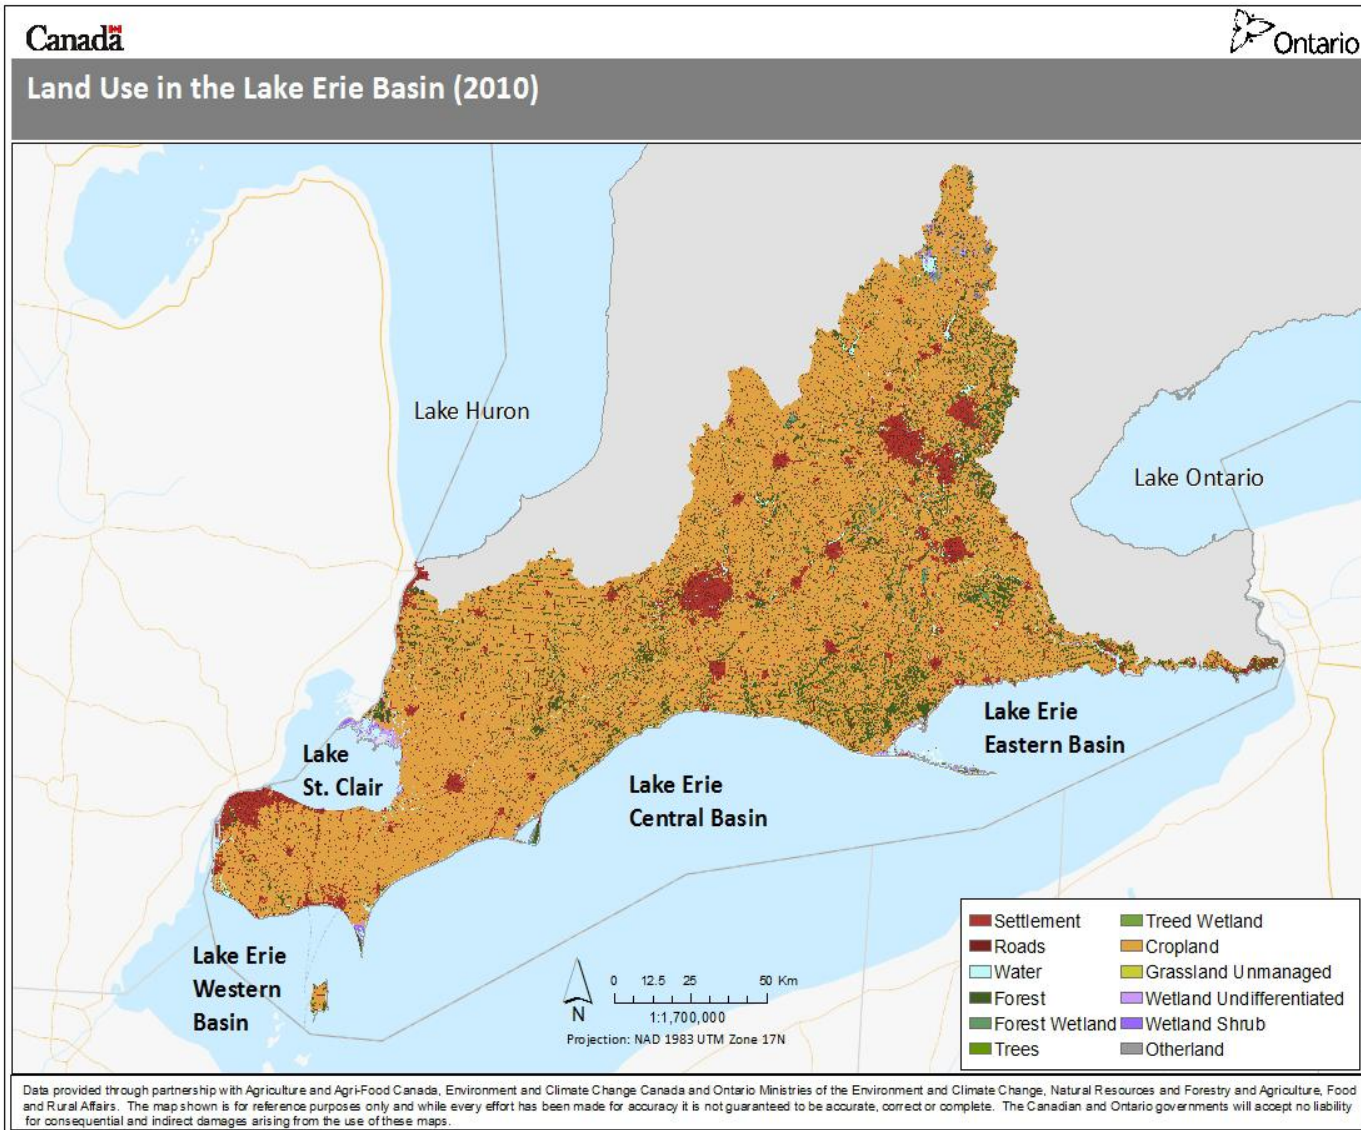

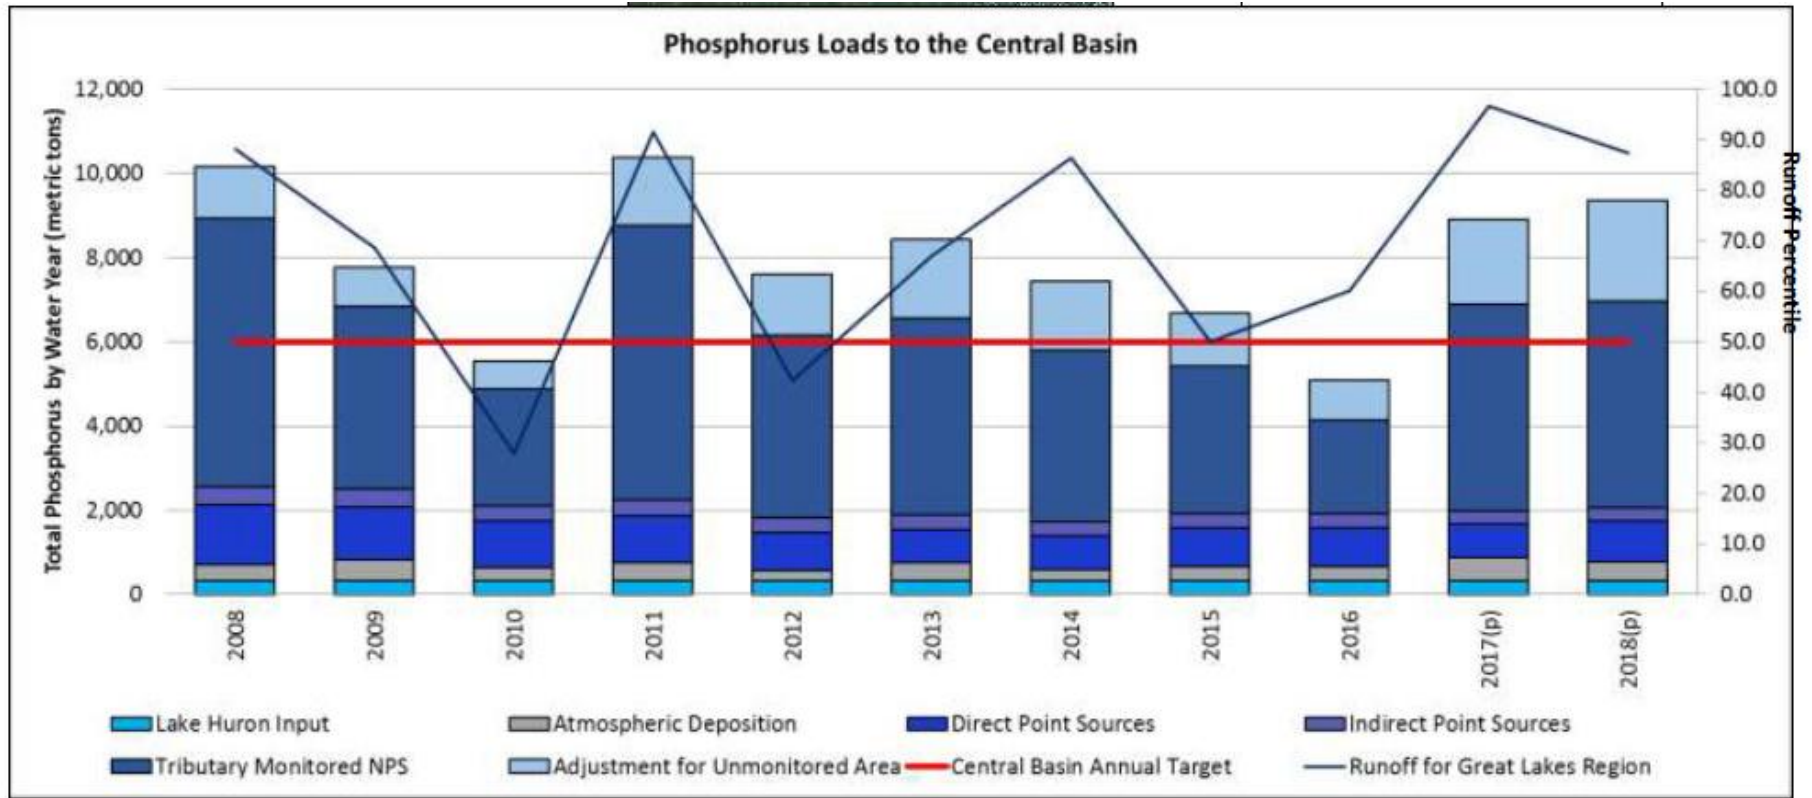

- *Great Lakes Protection Act*
 - Great Lakes Guardians' Council: Minister of OMAFRA is invited as a Great Lakes Minister
- Canada Ontario Agreement for Great Lakes Water Quality and Ecosystem Health (signed December 2014 and *expires December 2019*)
 - OMAFRA is a signatory to COA.
 - Member of COA Executive
 - Co-Lead for COA Annex 1 Nutrients (with ECCC, MOECP)
- Great Lakes Water Quality Agreement (signed 2012)
 - Member of Great Lakes Executive Committee
 - Member of Annex 4 Nutrients Subcommittee
- Great Lakes Commission
 - Associate Commissioner

40% phosphorus load reduction by 2025 for the **Ontario portion of the western and central basins** of Lake Erie, as well as an aspirational interim goal of a 20 percent reduction by 2020

Ontario's agricultural heartland

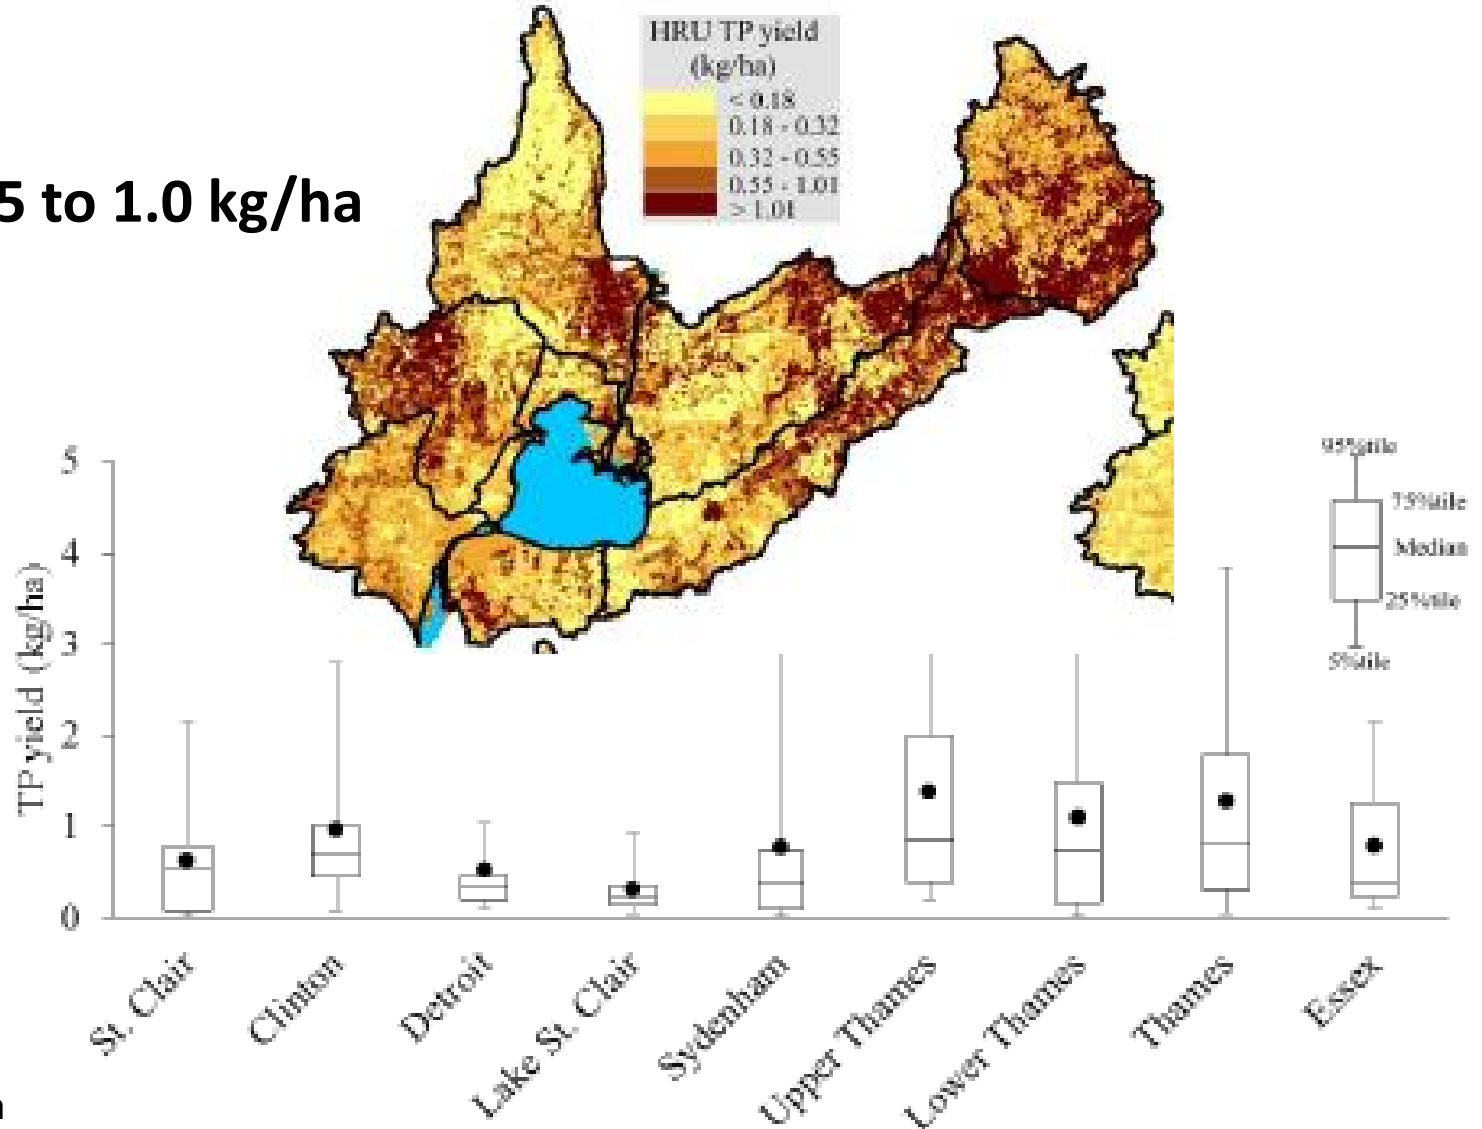

Total phosphorus loads (metric tons per water year) to the **central basin of Lake Erie** by source type (2008–2018).

Red line indicates central basin total phosphorus load **target** of 6,000 metric tons

Target Reduction = 213 mT/year

Modelled NPS Agricultural TP Loads

Mean: 0.5 to 1.0 kg/ha

Stewardship Programming

Lake Erie Agriculture Demonstrating Sustainability (LEADS)

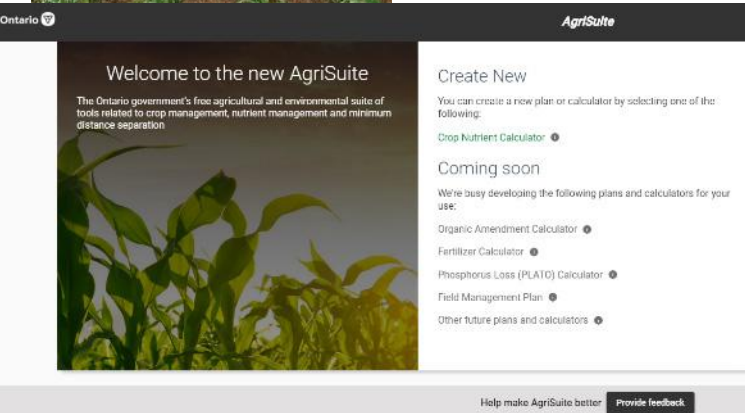

Current OMAFRA programming delivering on Great Lakes sustainability includes:

- Canadian Agricultural Partnership (Partnership) programming for Environmental Stewardship
- Lake Erie Agriculture Demonstrating Sustainability (LEADS), Canada-Ontario (under the Partnership)
- Agreement for Great Lakes Water Quality & Ecosystem Health (COA)
- Lake Simcoe Protection Plan

Multiple tools that complement each other are used across programs to bring about voluntary change:

<h3>Cost-Share Funding</h3>	<ul style="list-style-type: none"> • Provide financial Support for most Impactful BMPs
<h3>Build Awareness & Knowledge Transfer</h3>	<ul style="list-style-type: none"> • Inform of environmental challenges and share information on possible solutions
<h3>Develop Risk Assessment Tools</h3>	<ul style="list-style-type: none"> • Support targeted and informed decision-making

Best Management Practices ROTATION OF AGRONOMIC CROPS

In the years following World War II through to the 1980s, field crop farming underwent a period of unprecedented growth. Yields, crop quality and farm income all made remarkable gains thanks to production specialization, intensification, increased drainage, and improvements in genetics and inputs. However, evidence of problems in soil health and productivity began to appear, and has increased over time. There were exceptions to this trend. These were the farms that fed forages and used straw bedding, or used cereals, grasses and legumes to protect their soil over winter. In other words,

THE ROLE OF HEALTHY SOIL IN A CHANGING CLIMATE
Agriculture and climate are closely linked – anything that has a significant effect on our climate will influence farm production. Greenhouse gas (GHG) emissions and climate change are global concerns, and agriculture can be part of the solution. BMPs that improve soil health can also help lower GHG.

Best Management Practices NO-TILL FOR SOIL HEALTH

In conventional cropping systems, tillage is required to loosen the soil and prepare a suitable seedbed for germination and growth. In many cases, the timing and implements chosen have a definite pattern. If tillage is the only soil management practice used, over the long term, seedbed quality will decline with time. No-till systems require complementary best management practices (BMPs) that will build up the soil, diversify soil life and protect the surface from erosive forces. Conventional systems especially need soil BMPs to be sustainable. Another way to reduce tillage or eliminate it. Leading producers are making no-till work, and their soils are thriving. This fact sheet describes types of no-till systems, their benefits, challenges, and tips for successful implementation.

Best Management Practices WINTER COVER CROPS

Erudged soil should be covered year round. Bare soils are at risk of erosion by water and wind. There are three main approaches to keeping them covered – especially during the critical period starting at post-harvest of the primary crop until the emergence of the next crop the following spring:

- crop rotations that include forages or pasture can cover soils year-round (see BMPs for Soil Health Factheets – Crop Rotations and Pasture Systems)
- managing the residue from the primary crop to provide cover throughout winter (see BMPs for Soil Health Factheets – Residue Management, No Till, and Mulch Tillage)
- post-harvest (winter) cover crops.

This fact sheet describes some of the benefits, challenges, types and opportunities for growing cover crops in post-harvest conditions in Ontario.

THE ROLE OF HEALTHY SOIL IN A CHANGING CLIMATE
Agriculture and climate are closely linked – anything that has a significant effect on our climate will influence farm production. Greenhouse gas (GHG) emissions and climate change are global concerns, and agriculture can be part of the solution. BMPs that improve soil health can also help lower GHG emissions. Reducing phosphorus loss from fields to surface water, and improve resilience to drought or excessively wet conditions. Healthy soil – an essential component of a healthy environment – is the foundation upon which a sustainable agriculture production system is built.

Stewardship Programs beyond government:

Canada-Ontario Lake Erie Action Plan - Ontario Cover Crop Action Plan Healthy Soil Lowers Erosion and Keeps Lake Erie Clean 2019 and Beyond

The mainstream adoption of cover crops on farms in Ontario and farmer-knowledge of the value of planting cover crops has increased since the establishment of the Ontario Cover Crop Strategy. This document provides the details of the Cover Crop Action Plan to facilitate the adoption of cover crops on Ontario farms.

Facilitating the adoption of cover crops on farms in Ontario is an important part of the Canada-Ontario Lake Erie Action Plan; Partnering on Achieving Phosphorus Loading Reductions to Lake Erie from Canadian Sources. Cover crops can play an important role in stabilizing soil during the non-growing season and help to reduce the risk of erosion and nutrient loss.

In 2016, when farmers were looking for ways to address the issue of phosphorus in Lake Erie, a collaboration of farm stakeholders, under the name the Ontario Cover Crop Steering Committee, came together to figure out a strategy to facilitate the adoption of cover crops on farms in Ontario. The strategy was called the Ontario Cover Crops Strategy

and focused on four key areas: Research, Policy and Programs, Communication, and Champions.

This document outlines the work that has been completed to encourage and facilitate the adoption of cover crops on farms in Ontario. Cover crops have been a tool that farmers have used for more than a hundred years. Recently, there has been a resurgence of interest in the value of cover crops by early-adopters. The Cover Crop Action Plan has been built upon the momentum that was occurring in the countryside for planting cover crops. The Cover Crop Steering Committee has worked collaboratively to create action in the following areas outlined in the Ontario Cover Crop Strategy and put in place permanent processes for continuing the momentum. Protecting the environment is an important part of Grain Farmers of Ontario's strategic plan. Leading the implementation of the Cover Crop Strategy was an important initiative to address the issue of phosphorus in Lake Erie in addition to the commitment to implement the 4R Nutrient Management program.

Ontario Cover Crop Steering Committee Members

Certified Crop Advisor Association (CCA), Conservation Ontario, Grain Farmers of Ontario, Innovative Farmers Association of Ontario (IFAO), Ontario Agri-Business Association (OABA), Ontario Federation of Agriculture (OFA), Ontario Fruit and Vegetable Growers Association (OFVGA), Ontario Soil and Crop Improvement Association (OSCIA), Upper Thames River Conservation Authority
Committee Resource: Ontario Ministry of Agriculture, Food and Rural Affairs (OMAFRA)

An Action Plan with momentum

The Cover Crops Action Plan has built within it evergreen activities that will renew interest in cover crops within its Steering Committee membership. The Cover Crops Steering Committee will meet periodically to check in on the progress of these activities within the Action Plan until cover crops become the mainstay.

4R Ontario: Celebrating Successful Public-Private Partnership Models

2015 MOC

Canadian Fertilizer Institute (CFI) Ontario Agribusiness Association of Ontario (OABA) and OMAFRA

2017

Workplan Completed on joint funding model: workshops, training, 4R acres pilot, fertilizer & manure use surveys.

2019

28 full service ag retail outlets completed pre-audit in Western Ontario

5 sites went on to become fully certified. Horticulture working group commencing.

2016

Fertilizer Canada Pilots:
4R Certification for CCA's

4R & GLASI Farmland Health Check-up

Adapting the Ohio 4R Certification Program

2018 MOC

Finalize standards and audit forms.

Hired 4R Ontario Coaches to deliver FREE workshops.

New MOC signed with expanded membership

Multiple pre-audits in progress.

Marketing and communications adapted.

nutrient stewardship

4R Nutrient Stewardship can **help** grow crops sustainably

The 4Rs work to increase production/profitability for farmers while ensuring the future of the agricultural industry

RIGHT

SOURCE

RIGHT

RATE

RIGHT

PLACE

Sustainability Goals

Economic

- » Improve farm profitability by improving return on fertilizer dollars
- » Make the most of dollars spent on fertilizer
- » Contribute to improve regional economic development

Social

- » Improve access to sources of information to assist in farm management decision making
- » Improve productivity of farm labour by appropriate use of emerging technology that increase efficiencies of field operations and reduce costs per unit of crop harvested

Environmental

- » Prevent nutrient loss from cropping system
- » Improve recycling of crop nutrient from crop residues and livestock manures

The 4R Ontario MOC Steering Committee

Goals of the 4R Certification Program in Ontario

- » Optimize crop uptake of nutrients and minimize nutrient losses
- » Create long-term positive impacts on water bodies associated with agricultural production areas
- » Encourage sharing of the most up-to-date information
- » Help the agricultural sector adapt to new research and technology

How?

- » The 4R Certification Program is a voluntary program for Nutrient Service Providers in Ontario
- » 4R Nutrient Stewardship is translated into a set of 37 auditable standards
- » Nutrient Service Providers are only audited on what they can control
- » The 4R Certification Standards will be audited by a third-party audit body, on a two-year cycle, to maintain certification

Ontario 4R Certification Process and Resources

- » Step 1: Learn more about 4R Certification
- » Step 2: Guidance Book
- » Step 3: Book Your 4R Certification Pre-Audit
- » Step 4: Book Your 4R Certification Audit
- » Step 5: Get the word out!

Progress of 4R Certification in Ontario

4R-ON Summary (as of November 11, 2019)

4R Pre-audited Site Statistics:

- » **28** full service ag-retail locations completed a pre-audit in Western Ontario in 2018-2019
 - » **5** sites went on to complete full 4R certification in S. Ontario in same year
- » **25** of **28** locations located within Lake Erie watershed.

* 4R ON process is a pre-audit followed by a full audit to become certified.

Impact Analysis:

- 146 ag-retail locations identified in Western Ontario as potential 4R certified sites
- 19% of ag-retail locations in Western Ontario completed a 4R pre-audit
- 41% of ag-retail locations in Lake Erie watershed completed a 4R pre-audit
- 17% of pre-audited sites completed full certification in inaugural year *

*** 2016 Stats Canada Census

4R-ON Summary (as of November 11, 2019)

4R Certified Staff & Training

- » **97** employees have received 4R training
 - » **15** CCA's employees at 4R certified ag-retail locations
 - » **2** CCA-4R specialty certified
 - » **29** non-CCA crop recommendation staff
 - » **14** full-time application staff
 - » **39** seasonal staff
- » **Average** of 19 staff per site (incl. seasonal staff)
 - » **3** Certified Crop Advisors (CCA)
 - » **6** Crop input recommendation staff (non-CCA's)
 - » **3** Application staff

What is an Ag Retail Outlet?

Usually a full service farm supply company , Cooperatively or privately owned

- Seed
- Nutrients
- Plant Health
- Grain

What is in it to be a 4 R Certified Ag Retailer

4R Nutrient Stewardship is quickly gaining recognition with decision makers, agriculture groups, and growers as the gold-standard for on-farm nutrient management for stewardship in the Great Lakes basin

The framework has been identified by the International Joint Commission as an indicator of water quality, encouraging farmers to adopt 4R practices to reduce nutrient losses.

Getting Agri-retailers 4R Certified is the first step in expanding the reach of 4R Nutrient Stewardship to Ontario growers

A framework for excellence

Training

Application

Recommendation

Documentation

Training Requirement

T1- Nutrient Service Providers, sales, and application staff have undergone an initial training and staff are able to demonstrate knowledge about 4R Nutrient Stewardship and the 4R Certification Program.

Evidence

Meeting agendas, education log, or materials indicating 4R concepts and topics (Right Rate, Time, Place and Source) were covered, roster of those in attendance. Can be an interview with various staff. Educational information and sample presentations available at eLearning.fertilizercanada.ca & 4r.fertilizercanada.ca

Requirement

T 5 - Nutrient Service Provider has conveyed informational materials on 4R Nutrient Stewardship to all grower customers.

Evidence

Signature by grower, OR proof of attendance at a company sponsored 4R Nutrient Stewardship educational event, OR proof of distribution of materials via mailing list.

Application

Requirement

A2 - Phosphorus injection, subsurface banding, or broadcasting with immediate incorporation are the recommended placement methods unless the risk of phosphorus loss to surface water has been demonstrated to be low according to a provincially approved phosphorus index risk assessment procedure.

Evidence

Recommendation records indicate the recommended placement(s). Statement on phosphorus placement given/mailed to grower customers or grower customer signature indicating understanding.

Requirement

A3 - No winter/frozen ground application.

Evidence

Recommendation records indicate the preferred timing. Application records indicate there is no frozen ground or snow present. Frozen ground is defined: when soil conditions are such that tillage or nutrient incorporation and/or injection after application are not possible at the time of nutrient application, and will not be possible within the next 48 hours as a result of frozen conditions. Snow-covered ground is defined: when soil cannot be seen because of snow cover.

Soil test P and runoff P in Ontario

Six soil series, ten sites each, ranging in soil test P.

Standardized runoff boxes, rainfall applied at 3" per hour for 30 minutes runoff.

Application Requirement

A 7 -Broadcast applications of crop nutrients without immediate incorporation are neither made nor recommended unless a documented local weather forecast (verifiable private or government generated) indicates less than a 50% chance of a rainfall event involving more than 25mm (one inch) of rain beginning in the next 12 hours.

Evidence

The current weather forecast for the nearest town available to the fields is printed as a record within 12 hours of application. If the chance of precipitation exceeds 50%, the forecast total amount must be less than 25 mm (one inch).

A 10

No application of fall nitrogen other than co-applied with P sources or to meet fall crop N requirements.

Bringing you what's next.™

Recommendations

Bringing you what's next.

Requirement

R 2 - Soil tests are conducted at least once every 4 years.

Evidence

Review of records on file, can be hard copy or electronic. No soil test result may be older than 4 years old.

Requirement

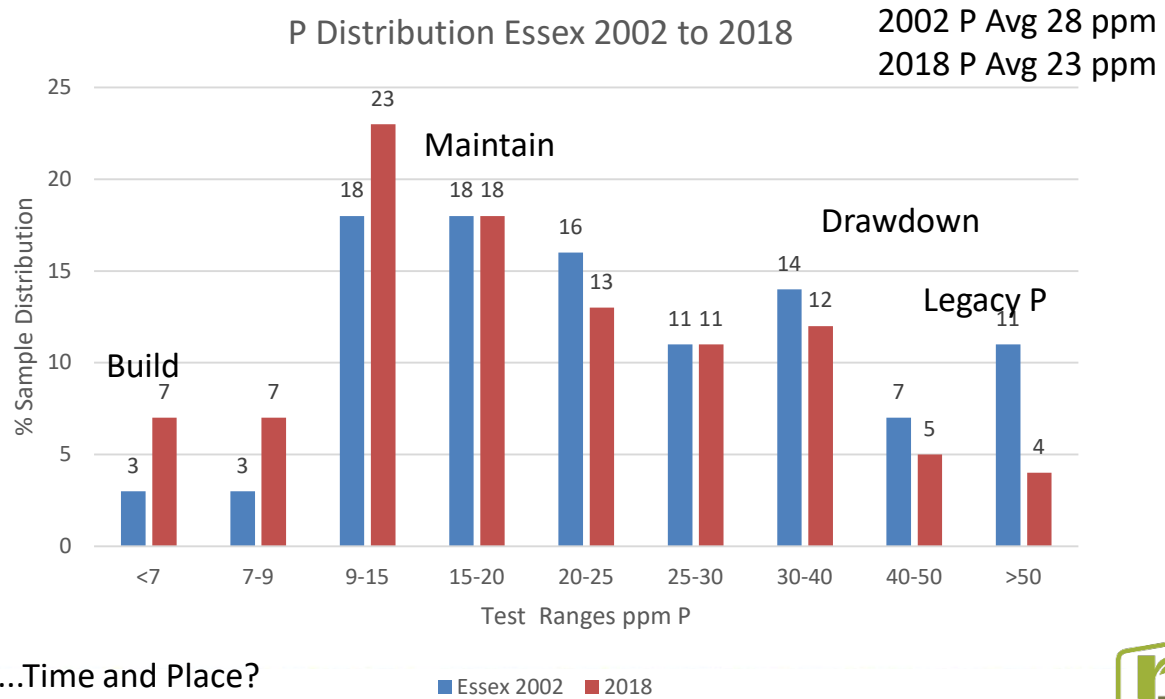

R7 For all nutrient recommendations and/or application, the inclusion of a minimum setback distance (e.g., 35-100 ft.) near known sensitive areas, such as tile inlets, well heads, gullies, and water bodies is documented and discussed with the grower customer.

Evidence

Setbacks discussed in meetings with grower customer, in subsequent years signatures of grower customers will be on file, or included on customer's application/recommendation cover sheet or maps.

Phosphorus Distribution in Essex County

Average P soil test is 22.9 ppm range is 7 to 73 ppm

21 of 46 acres are in the 15 to 20 ppm range

9 acres over 30 ppm

Bringing you what's next.™

Variable rate application strategy for Soybeans to be spring applied

Slightly above OMAFRA agronomic balance

But negative to neutral on crop removal balance with 4 acres building P test

Bringing you what's next.™

Documentation
